

Note on IR-TestV1

CASIA Iris Image Database for Testing Version 1.0 (or IR-TestV1) contains 10,000 iris images of 2,000 eyes from 1,000 subjects. The iris images of IR-TestV1 were captured using IrisGuard AD100 camera in one session. Each volunteer contributed 10 iris images of both left and right eyes, i.e. 5 images per each class. The main sources of intra-class variations in IR-TestV1 are motion blur, non-linear deformation, eyeglasses and specular reflections. All iris images are 8 bit gray-level BMP files and the image resolution is 640*480.
